

INDEX

- Abraham, R., 57, 70
- Advanced Composition Explorer (ACE), 203
- Albedo, 14
- Andoyer elements, 23
- Arnold, V.I., 57, 60
- Artificial three-body equilibria:
 - ideal solar sail, 199–202
 - realistic solar sail, 202–203
- Atmospheric density models, 7–12
- Ballistic capture transfers, 111–16
 - method of determining, 116–20
 - properties, 116–20
- Barker, 6
- Battin, R.H., 2, 55, 66
- Bekey, I., 212, 213
- Belbruno, E., 125
- Beletsky, V.V., 218–19, 220, 221
- Betts, J.T., 171, 175, 177
- Boundary value problem (BVP),
 - 174–5, 180
- Brouwer, 2
- Brumberg, V.A.L.S., 42, 43
- Bryson, A.E., 54, 174, 179
- Calculus, 25–6
- Cameron, A., 123
- Canonical perturbation, 32–4
- Capture problem, 108–10
- Cartmell, M.P., 209, 213, 217, 228, 230
- Cell mapping approach, 130
- Chaos, 120–3
- Clarke, F.H., 163
- Clemence, 2
- Clohessey–Wiltshire equations, 241–2
- Co-elliptic restricted four-body problem, 108
- Colombo, G., 48, 208, 212
- Connecting orbits, detecting, 139–40
 - hat algorithm, 140–1
 - Lorenz system, 143–5
 - numerical examples, 141–3
- Controlled systems, extension to, 145
 - application for mission to Venus, 148–51
 - controlled three-body problem, 145–6
 - coupling controlled three-body problems, 146
 - implementation, 148
 - patched controlled three-body systems, 147–8
 - reachable sets, 146–7
- Convex Mapping Principle (CMP), 175–6
 - and convergence, 176–7
 - feedback guidance/control, 178
 - linking theory, practice, computation, 177–8
- Coronal mass ejections (CME), 203
- Cosmo, M.L., 213
- Crandall, 174
- Davis, D., 123
- Delaunay elements, 23, 34, 37–9
- DIDO software package, 180–1
- Distributed space system (DSS), 181–5
- Drag, 7–12
- Dynamical systems, 127–8
 - circular restricted three body problem, 128–9
 - patching three-body problems, 129–30
- Earth Centered Inertial (ECI), 239
- EEO, 230–2
- Efroimsky, M., 36
- Euler angles, 23, 25
- Euler–Lagrange equation, 175–6
- European Space Agency (ESA), 117–18, 148, 190

- Formation flying:
 - analysis of controller performance, 256–8
 - background, 237–9
 - control/model predictive control
 - formulation, 243–9
 - distributed coordination through virtual center, 249–60
 - dynamics, 239–43
 - extensions to representations, 242–3
 - leader–follower, 249, 251–2
 - open loop robust control/replan frequency, 260–5
 - reference orbit, 250–1
 - reference point coordination, 250–5
 - simulations results, 255–60
 - total fuel cost analysis, 259–60
 - using closed-loop robust MPC, 265–73
 - virtual center, 252–5
- Fuel, 155–6
 - consumption, 160–1
 - expenditures measured by L^1 norms, 162
 - global optimality, 164
 - L^1 cost and L^p geometry, 163
 - minimum-fuel orbit transfer problem, 155, 179–81
 - penalty for not using L^1 cost, 163–4
 - quadratic cost is not $p = 2$, 161–2
- Gaposchkin, 8
- Gauge freedom:
 - benefits/advantages, 48–9
 - comparison of calculations, 47–8
 - disturbing function in frame co-precessing
 - with equator of date, 41–2
 - freedom of frame Choice, 40–1
 - gauge-invariant planetary equations of Lagrange/Delaunay types, 37–9
 - geometrical meaning of arbitrary gauge function, 34–6
 - planetary equations in precessing frame, written in terms of contact elements, 42–5
 - planetary equations in precessing frame, written in terms of osculating elements, 45–7
 - simple example, 26–8
 - under variation of Lagrangian, 28–32
- Gauss Variational Equations (GVEs), 238, 242
- Gaussian VOP (nonconservative forces), 18–19
- Genesis discovery mission, 128
- Geostorm mission, 199, 203–205
- Global Analysis of Invariant Objects (GAIO), 127
- Goldreich, P., 42, 43, 44–5, 48
- Gott III, J.R., 124, 125
- GRACE satellite, 14
- Gravity, 4
 - earth gravitational models, 5–8
- Grossi, M.D., 208
- Hager, W.W., 175, 177
- Hamiltonian Minimization Condition (HMC), 170–3, 180
 - HMC on HJB, 173–4
 - HMC on Minimum Principle, 174–5
- Hamiltonian variation, 32, 34, 39
- Hamilton–Jacobi equation, at higher orders, 99–102
- Hamilton–Jacobi equation, local solutions, 77, 99
 - combined algorithm, 83
 - convergence/existence, 83–7
 - curse of dimensionality, 82–3
 - direct approach, 82
 - direct solution for generating function, 78–81
 - direct/indirect comparison, 82–3
 - error in approximation, 88–90
 - examples, 87–90
 - indirect approach, 81, 82
 - practical considerations, 85–7
 - singularity avoidance, 80–1
 - theoretical considerations, 84–5
- Hamilton–Jacobi theory, 56–60
- Hamilton–Jacobi–Bellman (HJB) equation, 170, 173–4
- Hamilton’s principal function, 74–5
 - calculus of variations, 76–7
 - existence of, 75–6
 - fixed initial time, 77
 - and generating functions, 76
- Hartmann, W., 123
- Hill three-body problem, 102–104
- Hill’s Equations of Motion, 239, 241–2, 271

- Hiten* spacecraft, 107, 117
 Ho, Y.C., 54, 174, 179
 Hohmann, W., 110
 Hohmann transfers, 110–11

 Instantaneous capture, 109–10
 Interstellar Heliopause Probe (IHP), 191
 Invariant manifolds computation, 135–6
 continuation algorithm, 136
 convergence result/error estimate, 136–8
 Isaaks, J.D., 208

 Jupiter, 128

 Kaplan, 2
 Karush–Kuhn–Tucker (KKT) conditions, 172–3, 177
 Kaula, 2
 Kelly, W.D., 212
 Kelso, 9, 11
 Kepler elements, 24
 Kinoshita, T., 43
 Kramden, R., 210
 Kreyszig, 1
 Kumar, K., 213

 Lagrangian VOP (conservative forces), 17, 23, 24, 28–32, 37–9
 Lainey, V., 49
 Lambeck, 2
 Lanczos, C., 75, 77
 Lawden's equations, 242
 Lennert, S., 209
 Levin, E.M., 218–19, 220, 221
 Linear parameter-varying (LPV) model, 245
 Linear Programming (LP), 237, 244, 247, 249, 255
 Linear systems theory, 63, 98–9
 Hamilton–Jacobi equation, 64–5
 initial conditions, 65–6
 perturbation matrices, 66–7
 singularities of generating functions/
 relation to state transition
 matrix, 67–9
 Linear time variant (LTV), 245
 Lions, 174
 Lorenzini, E.C., 212, 213
 Low Earth orbit (LEO), 178, 190, 209, 212, 217, 231–2

 Low-energy transfers, 107–108
 ballistic capture regions/transfers, 112–20
 ballistic capture transfers, 111–12
 capture problem, 108–10
 chaos and weak capture, 120–3
 Hohmann transfers, 110–11
 origin of Moon, 123–5
 Lunar-tether orbit (LTO), 230–2
 Lyapunov orbits, 129–30

 Mars, 194, 207
 Marsden, J.E., 57, 70, 107
 MATLAB, 178, 181, 255
 Mercury, 192, 194, 197
 Minimum Principle, 163, 165, 168, 170, 174, 176–7, 181
 Model predictive control (MPC), 243, 244, 260–5
 closed-loop robust MPC, 265–73
 Moon, 194, 208, 230
 origin of, 123–5
 Moravec, H., 208
 Mordukhovich, B.S., 175
 Moritz, 2
 Motorised Momentum Exchange Tethers (MMETs), 209
 Moulton, F.R., 72
 Moyer, H.G., 179
 Mueller, 2

 NASA, 190
 Newton, Isaac, 24, 163
 Nonlinear L^1 -optimal control problems:
 issues in solving, 170–5
 solving, 175–8
 Nonlinear problems (NLPs), 177
 Non-linear systems theory, 69–70, 99
 Lagrangian submanifolds and study of
 caustics, 70–4
 Norton, E., 210

 Orbital dynamics, 23–4
 gauge freedom, 34–49
 historical background, 24–6
 normal form of Cauchy, 49–50
 precession of equator of date relative to
 equator of epoch, 50–1
 Osculating ellipse, 110
 Osculation, 32–4
